

Lease Abstraction and Data Entry Standards

Doc ID: SOP-LEASE-001 | Version: 1.0 | Effective: 2024-01-10 | Category: Lease Administration

Purpose

This standard defines how an executed lease is abstracted into Yardi Voyager so that billing, recoveries, and reporting are driven by accurate lease data.

Required Fields

Every lease record must capture the tenant legal name, suite or unit, rentable square footage, lease commencement and expiration dates, base rent schedule, escalation terms, and the recovery method for operating expenses. The rentable square footage drives the tenant's pro-rata share for recoveries, so it must match the executed lease exactly.

Critical Dates

Enter all critical dates including rent commencement, expiration, renewal option deadlines, and any early termination rights. Critical date notifications are configured so that option and termination deadlines are not missed.

Recovery Setup

Record the recovery method (for example net, base year stop, or gross) and any caps, exclusions, or gross-up provisions. These drive the CAM reconciliation, so an error here flows through to every recovery calculation.

Verification

A second reviewer confirms the abstract against the source lease before the lease is activated for billing. The annual base rent and the square footage are the two highest-risk fields and must be independently verified.

Amendments

When a lease is amended, the amendment is abstracted and linked to the original lease rather than overwriting history. The effective date of each amended term must be recorded so that billing changes apply from the correct date.
